## 5. Gradient Based Approach

### Learning Algorithm: Gradient Based Approach

**Video**[Download video file](#)**Transcripts**[Download SubRip \(.srt\) file](#)[Download Text \(.txt\) file](#)**True or False**

0 points possible (ungraded)

Let  $R_n(\theta)$  be the least squares criterion defined by

$$R_n(\theta) = \frac{1}{n} \sum_{t=1}^n \text{Loss} \left( y^{(t)} - \theta \cdot x^{(t)} \right).$$

Which of the following is true? Choose all those apply.

☒ The least squares criterion  $R_n(\theta)$  is a sum of functions, one per data point.☐ Stochastic gradient descent is slower than gradient descent.☒  $\nabla_{\theta} R_n(\theta)$  is a sum of functions, one per data point.**Solution:**

For every point, the loss is a function of  $\theta$ , so the least squares criterion  $R_n(\theta)$  is a sum of functions, one per data point, and this is what makes stochastic gradient descent possible. We want to do stochastic gradient descent because it is faster than gradient descent. Finally, because  $R_n(\theta)$  is sum of functions, one per data point,  $\nabla_{\theta} R_n(\theta)$  is also a sum of functions one per data point.
